The Airborne Spectral Photometric Environmental Collection Technology (ASPECT) is a small aircraft EPA uses to detect and gather chemical data to assist response agencies in the US. ASPECT uses a variety of sensors and cameras that can quickly collect data and information and provide it to emergency response teams. The ASPECT aircraft scanned the Emergency area for over 70 different chemical signatures but only detected Ammonia at levels that may have irritating effects but below levels that can cause long term effects of an acute or chronic nature.
